Biometrics Authentication, An Introduction:

Traditionally, user names and passwords have been the only practical solution in validating user identity. Unfortunately, they pose the biggest headache for IT professionals and end users alike. Help desks are overwhelmed by password related inquiries. Passwords are routinely shared, scribbled on sticky-notes, or written down and placed in easy-to-find locales. User names and passwords continue to fall short when it comes to real security; continued advancements in technology put any experienced hacker on a level playing field with IT security personnel.

As Biometric Technology evolves, we will continue to offer superior security solutions to business and consumers. **USA Supreme Technology is excited at maintaining its position as a leader in the field of Biometrics** **Our Biometric security solutions effectively address your security concerns.**

Biometrics is ideal when absolute verification of identity is required. While previously cost prohibitive, and primarily utilized in critical situations, such as nuclear power plants, large financial transactions, securing sensitive data etc., biometrics has evolved into an affordable security solution.
